

Alkaline Zinc Rack Plating

Zinc plating for:

- Long parts
- Flat parts
- Complex shapes

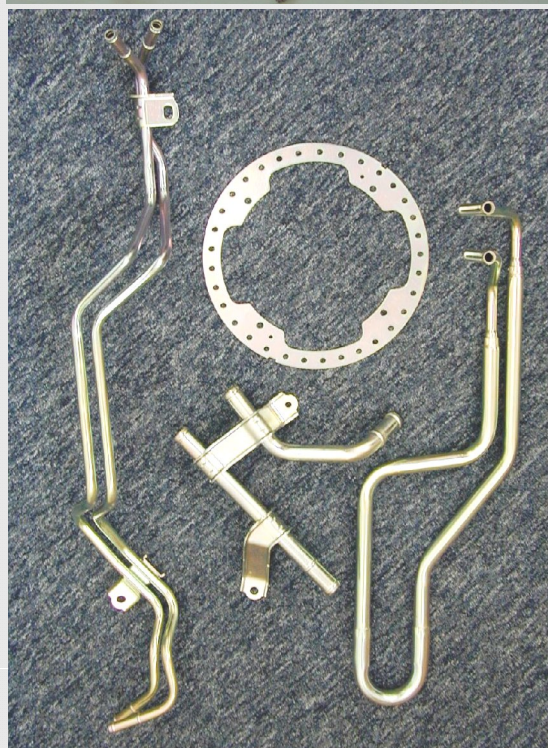

Modern Plating Coatings & Finishes specializes in zinc plating long parts, flat parts, and parts with complex shapes. The company uses a computer controlled rack plating line with alkaline zinc chemistry to insure a consistent, high quality finish on the parts.

The Company is capable of handling a variety of part sizes and configurations and is particularly adept at providing consistent plating on tubes and other difficult to plate parts. The accompanying photos show a small sample of the parts that are finished at Modern Plating.

Modern Plating Coatings & Finishes is approved for many automotive specifications and provides finishes for both the Japanese and European transplant companies as well as the North American based automotive companies.

The alkaline zinc and related topcoats used at Modern Plating were developed specifically to provide environmentally friendly corrosion protection. The finishes are all trivalent (chrome 3) and were developed in response to the European Union's (EU) End of Life Vehicle (ELV) Directive which is designed to insure that at the end of their useful life, vehicles can be discarded without endangering the environment.

Modern Plating Coatings & Finishes works closely with our customers to insure complete satisfaction. Early involvement in the part design process helps insure the best possible finish at the lowest possible cost.
